TUTORIAL

Merge 2 Sorted Arrays

Chapter

1. Merge 2 Sorted Arrays

Topics

- 1.2 Solution Approach 1
- 1.4 Solution Approach 2
- 1.6 Video Solution

Given two sorted arrays A and B, the task is to merge them and create one single sorted array.

Examples:

Input:

```
A[] = \{1, 5, 8\}

B[] = \{6, 9\}
```

Output:

```
Merged Array = {1, 5, 6, 8, 9}
```

Solution Approach - 1

The naive approach is to create an array of size n+m, then insert the elements of both arrays in that array and finally sort that array.

Algorithm:

- Create an array C□ of size n + m, where n and m is the size of array
 A□ and B□ respectively.
- 2. Traverse the two given arrays one after another and copy all their elements in C[].
- 3. Then sort the final array C[] using any sorting algorithm.

Clearly, the time complexity of the first step will be **O(n+m)**, and for the second step using any sorting algorithm can give us the best time complexity of **O((n+m)log(n+m))**.

Now the question arises why do we actually need to sort when it is given that the two arrays A and B are already sorted. So in the next approach, we will see how to merge two sorted arrays without explicitly doing any sorting.

Time Complexity: O((n+m) + (n+m)log(n+m))

Space Complexity: O(n+m)

```
#include <bits/stdc++.h>
1
                                                              C++
   using namespace std;
2
3
   void mergeArrays(int A[], int B[], int n, int m, int C[])
4
       int j = 0;
5
       for (int i=0; i<n; i++)
6
           C[j++] = A[i];
7
       for (int i=0; i<m; i++)
8
           C[j++] = B[i];
9
       int N = n+m;
10
       sort(C, C+N);
11
   }
12
13
   int main(){
14
       int A[] = \{1, 5, 8\};
15
```

```
int n = sizeof(A) / sizeof(A[0]);
16
       int B[] = \{6, 9\};
17
       int m = sizeof(B) / sizeof(B[0]);
18
       int C[n+m];
19
       mergeArrays(A, B, n, m, C);
20
       for (int i = 0; i < (n + m); i++)
21
           cout << C[i] << " ";
22
       return 0;
23
   }
24
25
26
```

Solution Approach 2

The idea is to use the Merge operation of the Merge Sort.

Algorithm:

- 1. Create an array C□ of size n + m, and initialize a pointer k = 0 that will help us insert the elements in this final array.
- 2. Then start traversing the two given arrays A, B simultaneously using two pointers i, j. Every time compare A[i], B[j] and whichever is smaller, pick that element and copy to the kth position in C[] and increment the value of k as well as the pointer for the array whose element is picked.
- 3. Finally, once we've copied all elements from one array, we'll copy the remaining from the other into the merged array C[].

Time Complexity: O(n+m)

Space Complexity: O(n+m)

```
1 function mergeArrays(A,B){
2  let C = [];
3  let i=0,j = 0;
4  while(i<A.length && j<B.length){
5  if(A[i] < B[j]){
6  C.push(A[i++])</pre>
```

```
}else{
7
8
           C.push(B[j++])
9
      }
10
11
12
      while(i<A.length){</pre>
        C.push(A[i++])
13
14
      while(j<B.length){</pre>
15
        C.push(B[j++])
16
      }
17
      return C;
18
    }
19
20
    function main(){
21
      let A = [1,5,8]
22
      let B = [6,9]
23
      let C = mergeArrays(A,B)
24
      console.log(C.join(' '))
25
26
27
    main()
28
```

```
#include <stdio.h>
1
2
   void mergeArrays(int A[], int B[], int n, int m, int C[]){
3
       int i = 0, j = 0, k = 0;
4
       while (i < n \&\& j < m) {
5
           if (A[i] <= B[j])
6
               C[k++] = A[i++];
7
           else
8
9
               C[k++] = B[j++];
       }
10
       while (i < n)
11
           C[k++] = A[i++];
12
       while (j < m)
13
           C[k++] = B[j++];
14
```

```
15
    int main(){
16
       int A[] = \{1, 5, 8\};
17
       int n = sizeof(A) / sizeof(A[0]);
18
       int B[] = \{6, 9\};
19
       int m = sizeof(B) / sizeof(B[0]);
20
21
       int C[n+m];
       mergeArrays(A, B, n, m, C);
22
       for (int i = 0; i < (n + m); i++)
23
           printf("%d ", C[i]);
24
     return 0;
25
26
